Progressive numbness in the left leg

Date of Appointment	05/06/2025
Specialty	Neurologia
Type of Visit	Urgency/Emergency visit
Responsible Doctor	Dr. Vinicius Mita Xavier

Clinical Record

52-year-old male patient reports numbness and tingling on the lateral aspect of the left leg for 3 days, with progressive worsening. No associated low back pain. Physical exam: reduced sensation at L5, decreased patellar reflex on the left. Clinical impression of lumbar radiculopathy. Lumbosacral spine MRI requested. Anti-inflammatory medication prescribed and rest advised. Follow-up after imaging for management plan determination.
